

## ABSTRACT

5 The present invention provides an interlayer for a  
laminated glass which does not give rise to the moiré phenomenon  
even when the arrangement and pitch of its embossments are orderly,  
hence providing for good workability in cutting and laminating  
operations and good deaeration in preliminary contact bonding,  
thus insuring the production of a laminated glass of high quality  
with a minimum of rejects for reasons of air bubbles, and a  
10 laminated glass containing said interlayer.

15 The invention also provides an interlayer for a laminated  
glass which provides for good deaeration without a risk for  
premature marginal sealing even if the temperature at initiation  
of deaeration at preliminary contact bonding is not critically  
controlled and which does not require raising of temperature  
for achieving a marginal seal of the glass-interlayer assembly,  
and a laminated glass containing said interlayer.
